Understanding panelevels

During work with the BIUP's Item Placement Tool you will encounter the term Panelview and the FromPane and ToPane. This section will try to explain what this concept is and how to work with them.

Panelviews is an invention of SAP Business One on how to place items of a window on different tab-pages. For each tab is a Panelview tied to it represented by a simple numeric value. If we look at a window in SAP Business One will try to go into details.

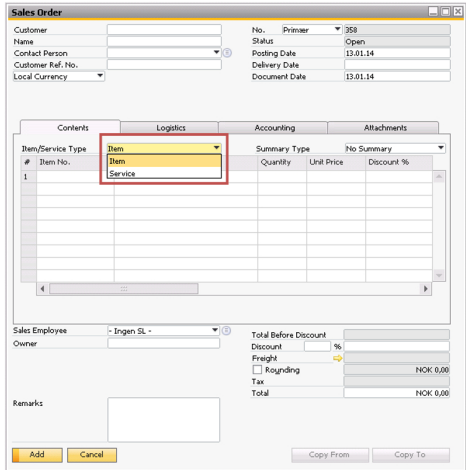

This is a window in SAP Business One and its current Panelview is 6. The reason for this is that the general tab is the active and by SAP definitions all data on the Item Master Data General tab is "tied" to pane 6 and on data like the Menu. If we were to press on the Purchasing Data tab the windows Panelview would change to 1 and show all items tied to pane 1. We also have a special pane called Panelview 0. Any Item that are placed on pane 0 will be shown no matter what Panelview the window currently is in. That's the reason why an item like Item Number are shown no matter what tab we are on.

Why a FromPane and a ToPane?

The above explanation works for about 95% of all items in SAP Business One windows and you can work from that. But the whole truth is a bit more complicated.

Each item in a window actually has a FromPane and a ToPane so the item can be on a range of panes. As mentioned this is very seldom used and most items from and to panes are the same (because it should only be shown on that single pane) One of the special places is the Sales and Purchase documents

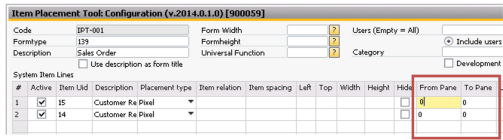

Because we have the Item/Service types and the Summary Type of document lines an item like the highlighted Combobox have a FromPane of 1 and a ToPane of 4. These four panes are used to show the different versions of the line-data and result in that if the window is on any of panelview 1, 2, 3 or 4 the Combobox will still be shown. In practice use only on documents would perhaps set the From and To pane to something different. Anywhere else you will let them be the same.

The use in BIUP and Panelview - 1?

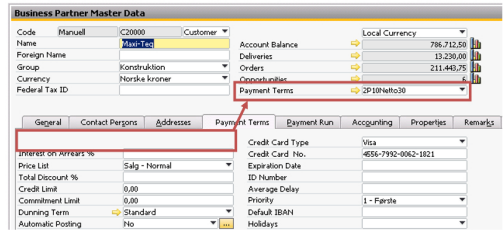

The Item Placement Tool and the Universal Function - Content Creator takes advantage of the Panelview system and let you manipulate the Panelview of existing items and set them for your own items to allow you to move items to other Panelviews (Tabs), move them to pane 0 (making the header data) and even to put them on panes that does not exist (which will result in that they are not shown)

Please note that the BIUP introduce a Panelview -1. All that this means is that BIUP should not make any changes to current Panelviews. This is used when you wish to move an item around on its current pane and not move it another.

Sample

Here we take the Price list items (label + Combobox) which is normally located on pane 6 (Payment terms) of the Business Partner Master Data and set its From and To pane to 0 instead.

If we look at the result of this change we see that the Panelview change + some additional pixel-moving (new top and left pixels) have moved the Price list data from the Payment Terms tab-page and made the data header data instead

Panelviews on most common windows

Item Master Data Panelview
<header data>
General
Purchasing Data
Sales Data
Inventory Data
Planning Data
